-! FUNCTION: One of the essential components for the initiation of
protein synthesis. Protects formylmethionyl-tRNA from spontaneous
hydrolysis and promotes its binding to the 30S ribosomal subunits.
Also involved in the hydrolysis of GTP during the formation of the
70S ribosomal complex (By similarity).
-!- SUBCELLULAR LOCATION: Cytoplasmic.
-!- SIMILARITY: BELONGS TO THE IF-2 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                  The invention relates to novel immunogenic polypeptides, Sp128 and Sp130 from S. pneumoniae. Vaccines comprising the polypeptides are useful for the treatment and prevention of pneumococcal infections, particularly infections caused by Streptococcus. The antigens are used as immunogenic agents to stimulate an immune response. The antisers and antibodies may also be used in diagnosing and treating pneumococcal infections may also be used in diagnosing and treating pneumococcal infections of antibodies serve as a mechanism for stimulating production of antibodies for use in passive immunotherapy, diagnostic reagents, and as reagents in other processes such as affinity chromatography. This sequence represents a Streptococcus pneumoniae protein of the invention. The proteins (or their homologues, derivatives and/or fragments) are useful as immunogens or antigens. Immunogenic or antigenic compositions comprising the proteins are useful as vaccines and also in diagnostic assays. The sequences are useful for the detection or diagnostic assays. The sequences are useful for the detection or the function or expression of the protein or pophylaxis or interfering with the function or expression of the protein or pophylaxis of S. pneumoniae infection. As the sequences can be used to treat S. pneumoniae infection, the elderly, and in patients which has high rates in they can be used to treat bacterial pneumonia, which has high rates in they can be used to treat bacterial pneumonia, which has high rates in they can be used to treat section, they can be used to treat section, they can be used to treat section with immunosuppressive disorders, allowed to the used to treat because of the protein or with immunosuppressive disorders, especially AIDS. They can also be used to treat pneumococcal septicaemia, otitis media, sinusitis, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1933 DIGEVSELKPHRVIVTIQNGKEMSSTIVSEEDFILPVYKGELEKGYQFDGWEISGFEGKK 1992

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ò
                                                          The invention relates to a protein comprising or having at least 50% identity to any of the 2469 amino acid sequences, identified in the specification (available on a computer readable format), or its fragment, expressed from 2469 of 2489 identified DNA coding regions from the Streptococcus pneumoniae type 4 strain genomic sequence appearing as ABS56454. Also included are an antibody which binds one of the proteins, treating a patient by administering the protein, DNA or antibody (in a composition), a kit comprising first and second primers, which are the nucleic acid cited above or fragments between nucleotides at 100 of a sequence contained within a Streptococcus nucleic acid sequence, where the first primer is substantially complementary to the target sequence and the second primer is substantially complementary to the target sequence and the second primer is substantially complementary to the complement of the target. Sequence and the second primer is substantially complementary to the complement of the target. Sequence is and where the parts of the primers having substantial complementarity define the termini of the target sequence to be amplified, assay comprising contacting a test compound with the protein, and determining whether the test compound binds to the protein and a Streptococcus pneumoniae bacterium, where one or more genes encoding the proteins has been rendered inactive. The proteins, medicaments for treating or preventing a disease or infection due to streptococcus bacteria, particularly S. pneumoniae, such as pneumonia, sepsis, otitis media or ear infection. They are also useful for identifying immunodominant proteins. The methods are useful for the the 2469 proteins expressed by the identified coding regions from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DIGEVSELKPHRVTVIIQNGKEMSSTIVSEEDFILPVYKGELEKGYQFDGWEISGFEGKK 2012

```
The present sequence represents a protein from Streptococcus pneumoniae.

The nucleic acid sequence encoding the Streptococcus preumoniae protein
can be useful in vaccines for inducing protective antibodies against
Streptococcus pneumonia, for treatment or prevention of infection e.g.
pneumonia, oritis media or meningitis. Probes based on the nucleic acid
are used to detect Streptococcus infection (by usual hybridisation or
amplification methods), also for isolating Streptococcus genes or their
allelic variants. The protein can be used similarly to detect specific
antibodies in standard immunoassays, especially for diagnosing or
monitoring infections. Antibodies which bind the protein are used to
detect corresponding antigens, to purify the protein and for passive
cimmunisation (optionally coupled to a toxin). Vaccines are administered,
e.g. by injection, orally or through the skin, typically at 0.01-1000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      98 KKDNPQVNHSQLNESHRKEDLQREEHSQKSDSTKDVTATVLDKNNISSKSTTNNPNK 154

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Staphylococcus epidermidis; open reading frame; ORF; bacterial infection; antibacterial; gene therapy.
                                                                                                                                (II) given in AGBB145 to AGBB120, from Staphylococcus spidermidis.

(I) and (II) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the S. epidermidis polypeptides (II) via the production of vectors containing them which are used to produce hosts cells which express the polypeptides. The polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their activity and therefore identify compounds that may be used for the treatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to AAH55090 represent specifically claimed S. epidermidis genomic DNA polynucleotide sequences from the present invention. AAH55991 to
                                                                                                                                                                                                                                                                                                                                                                                                                                    in the examplification of the present invention.

N.B. The present invention specifically claims all the polynucleotide sequences given in the sequence listing of the present specification, however the sequence listing only goes up to SEQ ID NO:4454 so even though sequences are given in the disclosure for SEQ ID NO:4465 to 4472, no sequences are present for SEQ ID NO:4465 to 4472,
                                                                                                                                                                                                                                                                                                                                                                                                               AAH55098 represent oligonucleotide sequences and primers which are used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   EISGFE----GKKDAGYVIN--LSKDTFIKPVFKKIEEKKEEENKPTFDVS----KK

                                                                                                                                                                                                                                                                                                                                                                                                                                Streptococcus pneumoniae antigens given in ABP44557 to ABP54669.
The S. pneumoniae antigens have antibacterial activity and can be used in vaccines. The S. pneumoniae antigens can also be used to prevent or attenuate a Streptococcal infection in an animal. The polynucleotides encoding the S. pneumoniae antigens can be used to detect Streptococcus nucleic acids. AB084905 to AB085130 represent primers used in the cloning of S. pneumoniae ORFS (open reading frames) which are used in an example from the present invention.
                                                                                                                                         Fannon MR;

                                                                                                                                                                                                                                 .9-MAY-1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                    ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP315124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis life cycle or inhibit S. epidermidis infection.

N. B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO web site.
                                                                                                                                                                                                                                                                                                                                                                           1 DTGEVSELKPHRVTVTIQNGKEMSSTIVSEEDFILPVYK------GELEKGYQFDGW--- 51

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ઠે
                                                                                                 Also described are: (1) mucleotide sequences (II) encoding (I); and (2) vaccines against P. falciparum infection comprising (I) or (II).

(I) and (II) are useful for the development of vaccines against P. falciparum infection. (I) and polyclonal antisera or a monoclonal antibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they are rifins or secreted or membrane proteins) can aid the identification of drugs to treat or prevent P. falciparum infection, or they can be used to identify drug resistance in infection, or they can be used to identify drug resistance in subsequent identification of proteins encoded by it will help to expand our understanding of parasite biology, a process hampered by the complexity of the parasite lifecycle, and provide new targets for complexity of the parasite lifecycle, and provide new targets for resistance to insecticides have led to a resurgence of malaria in many
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               10;
                                                                                                                                                                                                                                                                                                                                      parts of the world, and there is a pressing need for vaccines and new drugs. AAA70078 to AAA70287 and AAB18144 to AAB18352 represent nucleotide and protein sequences given in the present invention, but which are not specifically mentioned within the specification.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                              New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -
                                                                                                                                                                                                                                                                                                                                            capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Von Willebrand factor binding protein; vWb; immunogen; antibacterial;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /note= "Mature von Willebrand factor binding protein"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                            The invention relates to an isolated nucleic acid detection reagent
                                                                                                                                                                                                                                                                                                                                                                                                                                              insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Staphylococcus lugdunensis von Willebrand factor binding protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           25;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAE20967;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence
```

```
The present invention describes proteins and their fragments (I) encoded by chromosome 2 of the human malarial parasite, Plasmodium falciparum. Also described are: (I) nucleotide sequences (II) encoding (I); and (2) vaccines against P. falciparum infection comprising (I) or (II).

CC (I) and (II) are useful for the development of vaccines against CC intibody raised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they are rifins or secreted or membrane proteins) can aid the identification of infection with P. falciparum. Furthermore, (I) falciparum. Sequencing of the Plasmodium chromosome 2 and the infaction, or they can be used to identify drug resistance in falciparum. Sequencing of the Plasmodium chromosome 2 and the complexity of the parasite biology, a process hampered by the complexity of the parasite biology, a process hampered by the complexity of the parasite biology, a process hampered by the complexity of the parasite biology, a process hampered by the complexity of the parasite biology, a process hampered by the parasite of insecticides have led to a resurgence of malaria in many cresistance to insecticides have led to a resurgence of malaria in many drugs. AAA70078 to AAA70287 and AAB18144 to AAB18352 represent nucleotide conditional with the present invention, but which are not process.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  2173 KPYKIT---ENNKK-----NEGNEILKKYSIENEEKANYDKEQNENCILDKDIQCNVNT 2223

                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to von Willebrand factor binding protein or polypeptide (vWb) from Staphylococci. The vWb and immunogens of vwb are useful in vaccines to combat infections caused by Staphylococci. The invention is also useful for detection of Staphylococcal infection and purifying von Willebrand factor from a complex solution. The present sequence is Staphylococcus lugdunensis vWbl protein.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags continued to the control of (II) or to treat disease therapy techniques to restore normal activity of (II) or to treat disease states involving to restore normal activity of (II) or to treat disease states involving to restore normal activity of (II) or to treat disease states involving a cod supplement. (II) and it issue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical inspirate and polymicleotide sequences have applications in disgnostics, for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences and products dependent on DNA and amino acid sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                68 LSKDTFIKPVFKKIEEKKEEENKPTFDVSKKKDNPQVNHSQLNESHRKEDLQRE----E 122

                                                                                                                                                                            Homo sapiens
AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatocropic; vulnerary; antipsoriatic; antipornian; notropic; neuroprotective; osteopathic; anticonvulsant; antiathritic; immunosuppressant; immunostimulant; cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermatological; antimusouspressive; antidiabetic; hypotensive; dermatological; antimusouspressive; antithromatory; antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating or treating conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, conditions and nucleic acids may be used to treat cancers, graft vs host disease, cardiovascular disorders, osteoarthritis, graft vs host disease, cardiovascular disease, diabetes mellitus, hypertension, hypothyroidism, cholesterol ester storage, systemic lupus

Human colon cancer antigen protein sequence SEQ ID NO:859.

(first entry)

09-MAR-2001

AAB53319;

AAB53319 standard; Protein; 758 AA.

AAB53319

```
The present sequence is cell cycle regulation protein-5 (CECRP-5). Blast analytical method was used to identify this protein. CECRPs are activators of cell proliferation or inhibitors of cellular processes that modulate proliferation. They are used to treat or prevent cell proliferative diseases like cancers, atherosclerosis, cirrhosis, hepatitis, psoriasis, immune system disorders (e.g. acquired immune deficiency syndrome, allergy, asthma, Crohn's disease, rheumatoid arthritis). Antibodies are raised to screen for specific binding agents. The corresponding nucleic acid is used in gene therapy, chromosomal mapping and isolation of related sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel regulatory proteins, for diagnosis, treatment and prevention of cell proliferative and immune system diseases

Colon cancer associated gene sequences, referred to as colon cancer antigens, useful for the treatment, prevention, and diagnosis of colon disorders such as colon cancer

Claim 11; Page 1408-1411; 2104pp; English.

```
AAC97991 to AAC98763 encode the human colon cancer associated proteins, called human colon cancer antigens, given in AAB53234 to AAB54006. The human colon cancer antigens can have cytostatic, cardioactive, muscular; neuroprotective, immunomodulatory, gynacecological, gastrointestinal, vulnerary, nephrotropic, antilnfective and antibacterial activities, and can be used in gene therapy. The colon cancer antigen polymucleotides, proteins and antibodies to the proteins are useful for the prevention, treatment and diagnosis of colon disorders, such as colon cancer. The polymucleotides may be used in diagnostics and research, such as for chromosome identification, and as hybridisation probes. The proteins may also be used to prevent diseases such as neural disorders, immune system disorders, muscular disorders, reproductive disorders, immune system disorders, muscular disorders, reproductive disorders, immune diseases, and cardiovascular disorders, and cardiovascular disorders, and cardiovascular disorders, and cardiovascular disorders, exemplification of the present

                                                                                                                                                                                             Staphylococcus epidermidis; open reading frame; ORF; bacterial infection; antibacterial; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABB35124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis life cycle or inhibit S. epidermidis infection.

N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the

producing hyperimune serum-reactive antigens from a pathogen, cumour, a listue or host prome to auto-immunity, where the antigens are used in a vaccine, comprises providing antibody preparation from a plasma pool of a type of animal, or individual sera with antibodies against the specific pathogen, tumour, allergen, tissue or host prome to auto-immunity. The hyperimune serum-reactive antigens comprising any of the 62 sequences of 53-261 amino acids fully defined in the specification, or their hyperimune fragments are useful for the manufacture of a pharmaceutical preparation, particularly a vaccine or epidermidis. The preparation of antibodies is useful for the manufacture of a medicament for treating or preventing staphylococcal infections or colonisation against S. aureus or S. colonisation against S. aureus or S. colonisation against S. aureus or S. epidermidis. The antibody preparations may also be used for diagnostic and imaging purposes. Other conditions that can be treated include cancer, autoimmune diseases or infections caused by viral (e.g. HIV, hepatitis A, B or C); fungal or protozoan pathogens. This sequence represents a staphylococcal protein relating to the method for identifying and producing pathogen specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   341 KMTDLQDTKYVVYESVENNESMMDTFVKH-----PIKTGMLNGKKYMVMETTNDDYWKDF 395

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes an isolated antibody (I) that binds to a staphylococcal surface protein selected from any of the 12 sequences of 554-2283 amino acids given in ABP56875 to ABP56886. Also described:

(I) an isolated antisera (II) comprising (I); (2) a diagnostic kit (III) comprising (I) and means for detecting binding by (I); (3) diagnosing (MI) an infection of Staphylococcus aureus by adding (I) to a sample suspected of being infected with the infection, and determining if antibodies have bound to the sample; (4) a pharmaceutical composition (IV) for treating or preventing an infection of S. aureus comprising (I), and a vehicle, carrier or excipient; (5) treating (M2) or preventing an infection of S. aureus of a human or animal an immunogenic amount of the isolated surface protein; and isolated active fragment (V) from the A domain of the DsgA protein; and solated active fragment (V) from the A domain of the DsgA protein; and (R) a vaccine (VI) for treating or preventing an infection of S. aureus comprising the surface protein in an amount effective to elicit an immune response, and a vehicle, carrier or excipient. (I) has antiinflammatory, antibacterial, immunosuppressive and antiarthritic activities, and can be

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher ewkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                      404

used in gene therapy. The antibody, composition and vaccine are useful for treating or preventing Staphylococcus aureus infection in a human or animal, such as pneumonia, septic arthritis, endocarditis or biomaterial related infections. The present sequence represents Staphylococcus epidermidis KrkN protein, which is used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell

immunise and prevent disease. Diseases diagnosed, prevented or treated include: bacterial infections, especially Staphylococcus aureus infections which cause oritis media, toxic shock syndrome, conjunctivitis, wound infection, impetigo and septic arthritis etc. Tig polypeptides, polymucleorides and their (ant)agoniets can prevent adhesion of bacteria to matrix proteins, and are useful for use on wounds and body implants to prevent bacterial infection.
activity of the protein by measuring the binding to tig and observing the stimulation or inhibition of the polypeptide function. These can be used in treatment to inhibit or enhance tig activity, in addition to direct administration of tig polypeptide to treat conditions associated with a lack of tig polypeptide, or direct administration of antisense sequences to prevent expression. Tig polypeptides (administered directly, in a vector and as a vaccine) and antibodies induce an immune response to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              113 AIDHSLGHLAEMVVKEDGVVENGDTVNIDFSG-SVDGEEFEGGQAEGYDLEIGSGSFI-P 170

                                                                                                                                                                                                                                            This sequence is the Staphylococcus aureus trigger factor (tig) polypeptide of the invention. Tig polypeptides and polynucleotides are useful for diagnosing diseases related to over or underexpression of tig protein by identifying mutations in the tig gene, or determining tig polypeptide or mRNA expression levels due to an infection of an organism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Trigger factor; tig; diagnosis; immune response; bacterial infection; S. aureus infection; otitis media; toxic shock syndrome; conjunctivitis; wound infection; impetigo; septic arthritis; therapy.
         frames in the complete genome (see AAX91990) of Chlamydia pneumoniae.
C. pneumoniae causes respiratory disease such as pneumonia and disease, sarcoidosis, sinusitis, purulent otitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584-Y35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae.
 AAY34584-Y35879 represent the proteins encoded by all the open reading
                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New Staphylococcus aureus trigger factor (tig) polypeptide and polynucleotide, useful as diagnostic reagents and for prevention and treatment of Staphylococci aureus infections

polypeptides are also useful for screening compounds which affect
continuous are also useful for screening compounds which affect
continuous of the protein by measuring the binding to tig and observing the
stimulation or inhibition of the polypeptide function. These can be used
in treatment to inhibit or enhance tig activity, in addition to direct
administration of tig polypeptides to treat conditions associated with a
lack of tig polypeptide, or direct administration of antisense sequences
to prevent expression. Tig polypeptides (administered directly, in a
vector and as a vaccine) and antibodies induce an immune response to
immunise and prevent disease. Diseases diagnosed, prevented or treated
include: bacterial infections, especially Staphylococcus aureus
include: bacterial infection, impetigo and septic arthritis etc. Tig
polypeptides, polymucleotides and their (ant) agonists can prevent
and body implants to prevent bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               13;

                                         The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Pathogen specific antigen related staphylococcal protein SEQ ID No 142.

The invention relates to a novel method for identifying, isolating and producing hyperimmune serum-reactive antigens from a pathogen, tumour, allergen, a tissue or host prone to auto-immunity, where the antigens a re used in a vaccine, comprises providing antibody preparation from a plasma pool of a type of animal, or individual sera with antibodies against the specific pathogen, tumour, allergen, tissue or host prone to auto-immunity. The hyperimmune serum-reactive antigens comprising any of the 62 sequences of 53-261 amino acids fully defined in the moutacture of a pharmaceutical preparation, particularly a vaccine anulacture of a pharmaceutical preparation, particularly a vaccine against staphylococcal infections or colonisation against S. aureus or S. epidermidis. The preparation of antibodies is useful for the manufacture of a medicament for treating or preventing staphylococcal infections or colonisation against S. aureus or S. epidermidis. The antibody preparations may also be used for diagnostic and imaging purposes. Other conditions that can be treated include cancer, autoimmune diseases or infections caused by viral (e.g. HIV, hepatitis A, B or C), fungal or protezing to the method for identifying and producing pathogen specific antigens of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           341 KMTDLQDTKYVVYESVENNESWMDTFVKH-----PIKTGMLNGKKXMVMETTNDDYWKDF 395

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              5
                                                                                                                                                                                                                                                                                         capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLiology expressed DNA sequences (ABLiology) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       137 NFEEFTINMITTOODLLKNIY-SLLDK------DNEGAITSKELGMVIRALGROPNESIA 188

The invention provides the primary nucleotide sequence of the WSBV genome (AAH62689), predicted transcript sequences (AAH62689-AAH62839) and encoded proteins (AAG85101-AAG85051) and oligonucleotide sequences (AAH62840-63160) suitable for use as primare or probes. The nucleic acid molecules and proteins of the invention are useful for diagnosis and monitoring viral infection, in screens for antiviral agents and for monitoring viral gene expression or activity during a treatment regimen. The nucleic acid molecules are also useful as antisense constructs to control viral gene expression in infected cells and tissues and to create transgenic viral resistant shrimp.

(HELI-) HELIX RES INST

```
The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying cone allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by insertion or replacement fragment with a heterologous promoter, so that expression of the second allele is regulated by the promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles modified are useful for identifying a gene that contributes. to the survival or growth of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent, an antifungal agent that inhibits the growth of a diploid fungus contributes. (M1) is useful for identifying a compound which modulates the compound catabolism, blosynthetic, transporter, transcriptional, compound catabolism, blosynthetic, transporter, transcriptional, compound is signal transduction, DNA replication and cell division activity, or inhibit growth or proliferation of C. albicans cells and for translational infection by C. albicans need the invention. Note: The sequence data for this patent is not represented in the printed contribution to the European patent of the suronean patent of the suronean patent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    80 YDDDDDEFEGFESSNGAAKELNLSESQAIKEWKQRRDLEIEEREKLNSKKKEEIIEKAKS 139

The present invention describes primer sets for synthesising 5602

full-length cDNAs defined in the specification. Where a primer set
comprises: (a) an oligo-dT primer and an oligonucleotide complementary
to the complementary strand of a polynucleotide which comprises one of
the 5602 nucleotide sequences defined in the specification, where the
cligonucleotide comprises at least 15 nucleotides; or (b) a combination
of an oligonucleotide comprises a sequence complementary to the
complementary strand of a polynucleotide which comprises a 5'-end
sequence and an oligonucleotide comprising a sequence complementary to a
polynucleotide which comprises a 1'-end sequence, where the
oligonucleotide which comprises a 1'-end sequence, where the
oligonucleotide which comprises a 1'-end sequence, the pacification. The primer sets can be used in antisense therapy and
in gene therapy. The primer sets can be used in antisense therapy and
in gene therapy. The primers are useful for synthesising polynucleotides,
particularly full-length cDNAs. The primers are also useful for the
connection and/or diagnosis of the primers are also useful for the
connection and/or diagnosis of the primers are also useful for the
connection and/or diagnosis of the primers are also useful for the
connection and/or comprises of the primers and are also useful for the
connection and/or cliagnosis of the primers and are also useful set
connected by
the full-length cDNAs. The primers allow obtaining of the full-length
connected any specialised methods. AAH031629 to AAH13632
ceptreent oligonucleotides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopoiesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorder; arthritis; inflammation.

                                                                                                                                                                                                                                                                                                                                                                 production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity infinity in activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; cytokine; cell proliferation; cell differentiation; gene therapy; vaccine; peptide therapy; stem cell growth factor; haematopoiesis;

The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM89302) that exhibit activity elating to erytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymerleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ma Y;

The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying cone allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by insertions or promoter. So that expression of the second allele by the promoter. So that expression of the second allele is regulated by the promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles modified are useful for identifying a gene that contributes to the survival or growth of a fungus, a gene that is sesential to the survival or growth of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent that inhibits the growth of a fungus to an antifungal agent that inhibits the growth of a diploid fungus of disease. (M1) is useful for identifying a compound which modulates the activity of a gene product, preferably enzymatic activity, carbon compound catabolism, blosynthetic, transporter, transcriptional, compound stabolism, blosynthetic, transporter, transcriptional, compound to inhibit growth or proliferation of C. albicans cells and for translational, signal transduction, DNA replication and cell division activity. The method is useful for identifying a compound having the ability to inhibit growth or proliferation of C. albicans cells and for transitication but is based on sequence information supplied to Derwent by parament of the pronent by the propersure of the propertion of the pronent by the propertion of the pronent by the propertion of the propertion of the pronent by the propertion of the propertion of the propertion of the propertion of the propertion of the propertion of the propertion of the propertion of the propertion of the propertion of the propertion of the propertion of the propertion of the propertion of the propertion of the propertion of the propertion of the propertion of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Constructing strains for identifying gene products as effective targets for therapeutic intervention, by inactivating in the strain one allele of a gene and placing other allele of the gene under conditional

Sequences ABB10381-ABB12330 represent 1350 novel human polypeptides, and sequences ABB0825-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a comprising and nuclectide of the invention, methods of producing the novel polypeptides, antibodies against the polypeptides, methods of identifying compounds which chind to polypeptides of the invention. Although novel, many of the polypeptides of the invention have homology to known proteins, thereby collypeptides of the invention have homology to known proteins, thereby collypeptides of the invention have homology to known proteins, thereby collypeptides of the invention and polypeptides of the invention may contain an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may have various activities, including cytokine, cell proliferation or cell differentiation activities, seem cell growth factor activity; haematopoiesis regulatory activity; tissue growth activities; chemotactic or chemokinetic activities; haemacetaic, thrombotic or thrombolytic activities; receptor or ligand activities; or may be involved in oncogenesis, cancer cell proliferation or metastasis.

Depending on their biological activities, polypeptides and nucleotides of
                                                                                                                                                                                                                                                                                                                     Human; cytokine; cell proliferation; cell differentiation; growth factor; haematopolesis regulation; tissue growth; immunomodulator; activin; inhibin; ofmentaxis; chemokinesis; thrombolysis; oncogenesis; proliferation; metastasis; cancer; tumnour; haematopoletic disorder; myeloid cell disorder; lymphoid cell disorder; asthma; arthritis; atherosclerosis; coronary heart disease; arterial ischemia; bone disorder; osteoporosis; vascular growth disorder; issue regeneration; wound healing; infection; immune disorder; cell culture; drug screening; gene therapy; antiantlammatory; antiathmatic; antiathritic; haemostatic; antiarteriosclerotic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cytostatic, osteopathic; vasotropic; cardiant; virucide; antibacterial; antifungal; vulnerary; antiulcer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human proteins and DNA encoding sequences useful for preventing, treating or ameliorating a medical condition in a mammalian subject
                      Human secreted protein homologue, SEQ ID NO:2651.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 20; Page 323-325; 1963pp; English.

conditions, e.g., by protein or gene therapy. Such conditions include cancers, haematopoietic disorders (e.g., myeloid or lymphoid cell disorders), chronic inflammantory conditions (e.g., archima or arthritis), proliferative retinopathy, atherosclerosis, coronary heart disease, arterial ischaemia, bone disorders (e.g., osteoporosis), and abnormal conscious growth. Polypeptides involved with tissue regeneration and repair (or nucleic acids encoding them) may be used to promote wound repair (or nucleic acids encoding them) may be used to promote wound crepair (or nucleic acids encoding them) may be used to promote wound corporation and ulcers), while those with commondiatory activities may be used in the treatment of viral, chacterial and fungal infections in addition to immune disorders. Comprome cell growth factor activity may be used in cell cultures to promote cell growth factor activity may be used to neuroepithelial cells that can be used to augment or replace cells damaged by illness, cutoimmune disease or accidental damage. The polypeptides and nucleotides caucimmune disease or accidental damage. The polypeptides and in drug screening techniques. The present sequence represents a novel human companies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              2352 IAELOREPLLVNESLNVENSGFRTNEEIHSESYNKGEISSGRKDNAEAISGHSVEADP-- 2409

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAW78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymetides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, esg. stem cell growth factor activity, hammanomodulatory activity and activity, issue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            64

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynetides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, hematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity activity and activity and activity and activity and activity activity and activity of activity and activity of activity and activinihibin activity and activity and activity activity and activity activity and activity activity and activity activity and activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activity activi

The invention relates to a secretory polynucleotide (designated sptm)

comprising any of 567 polynucleotide sequences (ABZ15837-ABZ3643), a

maturally occurring polynucleotide sequence at least 90 % identical to

the polynucleotide sequence, a polynucleotide complementary to them or an

RNA equivalent of them. The polypeptide or polynucleotide are useful for

treating, preventing or diagnosing a disease or condition associated with

the expression of functional SPTM. These are particularly useful for

the expression of functional SPTM. These are particularly useful for

diagnosing, treating or preventing autoimmune/inflammatory disorders

(e.g. acquired immunodeficiency syndrome, anaemia, asthma or Crohn's

disease), neurological disorders (e.g. epilepsy, Huntington's disease,

multiple sclerosis, cerebral palsy, Parkinson's disease, anxiety,

schizophrenia or amnesia), or cell proliferative disorders (e.g.

psoriasis, polycythemia vera, or cancers including adenocarcinoma,

checkins of the invention (ABPF1584-ABPF5962).
